

Concept Note

The MP3 Player was created in order to allow users to play MP3 files within a Flash interface.

When the user selects a track, it begins to play as an image is loaded into the player; in addition, a progress bar shows the duration of the track as it plays. Users can start, stop, pause, fast forward and rewind the track.

The interface was inspired by antique wooden radios, with "dials" and a window screen to show the track information.
